

rec.1 Examples of Primitive Recursive Functions

cmp:rec:exa:
sec

We already have some examples of primitive recursive functions: the addition and multiplication functions `add` and `mult`. The identity function $\text{id}(x) = x$ is primitive recursive, since it is just P_0^1 . The constant functions $\text{const}_n(x) = n$ are primitive recursive since they can be defined from `zero` and `succ` by successive composition. This is useful when we want to use constants in primitive recursive definitions, e.g., if we want to define the function $f(x) = 2 \cdot x$ can obtain it by composition from $\text{const}_2(x)$ and multiplication as $f(x) = \text{mult}(\text{const}_2(x), P_0^1(x))$. We'll make use of this trick from now on.

Proposition rec.1. *The exponentiation function $\text{exp}(x, y) = x^y$ is primitive recursive.*

Proof. We can define `exp` primitive recursively as

$$\begin{aligned}\text{exp}(x, 0) &= 1 \\ \text{exp}(x, y + 1) &= \text{mult}(x, \text{exp}(x, y)).\end{aligned}$$

Strictly speaking, this is not a recursive definition from primitive recursive functions. Officially, though, we have:

$$\begin{aligned}\text{exp}(x, 0) &= f(x) \\ \text{exp}(x, y + 1) &= g(x, y, \text{exp}(x, y)).\end{aligned}$$

where

$$\begin{aligned}f(x) &= \text{succ}(\text{zero}(x)) = 1 \\ g(x, y, z) &= \text{mult}(P_0^3(x, y, z), P_2^3(x, y, z)) = x \cdot z\end{aligned}$$

and so f and g are defined from primitive recursive functions by composition. \square

Proposition rec.2. *The predecessor function $\text{pred}(y)$ defined by*

$$\text{pred}(y) = \begin{cases} 0 & \text{if } y = 0 \\ y - 1 & \text{otherwise} \end{cases}$$

is primitive recursive.

Proof. Note that

$$\begin{aligned}\text{pred}(0) &= 0 \text{ and} \\ \text{pred}(y + 1) &= y.\end{aligned}$$

This is almost a primitive recursive definition. It does not, strictly speaking, fit into the pattern of definition by primitive recursion, since that pattern requires

at least one extra argument x . It is also odd in that it does not actually use $\text{pred}(y)$ in the definition of $\text{pred}(y + 1)$. But we can first define $\text{pred}'(x, y)$ by

$$\begin{aligned}\text{pred}'(x, 0) &= \text{zero}(x) = 0, \\ \text{pred}'(x, y + 1) &= P_1^3(x, y, \text{pred}'(x, y)) = y.\end{aligned}$$

and then define pred from it by composition, e.g., as $\text{pred}(x) = \text{pred}'(\text{zero}(x), P_0^1(x))$. \square

Proposition rec.3. *The factorial function $\text{fac}(x) = x! = 1 \cdot 2 \cdot 3 \cdot \dots \cdot x$ is primitive recursive.*

Proof. The obvious primitive recursive definition is

$$\begin{aligned}\text{fac}(0) &= 1 \\ \text{fac}(y + 1) &= \text{fac}(y) \cdot (y + 1).\end{aligned}$$

Officially, we have to first define a two-place function h

$$\begin{aligned}h(x, 0) &= \text{const}_1(x) \\ h(x, y) &= g(x, y, h(x, y))\end{aligned}$$

where $g(x, y, z) = \text{mult}(P_2^3(x, y, z), \text{succ}(P_1^3(x, y, z)))$ and then let

$$\text{fac}(y) = h(P_0^1(y), P_0^1(y))$$

From now on we'll be a bit more laissez-faire and not give the official definitions by composition and primitive recursion. \square

Proposition rec.4. *Truncated subtraction, $x \dot{-} y$, defined by*

$$x \dot{-} y = \begin{cases} 0 & \text{if } x < y \\ x - y & \text{otherwise} \end{cases}$$

is primitive recursive.

Proof. We have:

$$\begin{aligned}x \dot{-} 0 &= x \\ x \dot{-} (y + 1) &= \text{pred}(x \dot{-} y)\end{aligned} \quad \square$$

Proposition rec.5. *The distance between x and y , $|x - y|$, is primitive recursive.*

Proof. We have $|x - y| = (x \dot{-} y) + (y \dot{-} x)$, so the distance can be defined by composition from $+$ and $\dot{-}$, which are primitive recursive. \square

Proposition rec.6. *The maximum of x and y , $\max(x, y)$, is primitive recursive.*

Proof. We can define $\max(x, y)$ by composition from $+$ and $\dot{-}$ by

$$\max(x, y) = x + (y \dot{-} x).$$

If x is the maximum, i.e., $x \geq y$, then $y \dot{-} x = 0$, so $x + (y \dot{-} x) = x + 0 = x$. If y is the maximum, then $y \dot{-} x = y - x$, and so $x + (y \dot{-} x) = x + (y - x) = y$. \square

cmp:rec:exa:
prop:min-pr **Proposition rec.7.** *The minimum of x and y , $\min(x, y)$, is primitive recursive.*

Proof. Exercise. \square

Problem rec.1. Prove **Proposition rec.7**.

Problem rec.2. Show that

$$f(x, y) = 2^{(2^{\cdot^{\cdot^{\cdot^{2^x}}}})} y \text{ 2's}$$

is primitive recursive.

Problem rec.3. Show that integer division $d(x, y) = \lfloor x/y \rfloor$ (i.e., division, where you disregard everything after the decimal point) is primitive recursive. When $y = 0$, we stipulate $d(x, y) = 0$. Give an explicit definition of d using primitive recursion and composition.

Proposition rec.8. *The set of primitive recursive functions is closed under the following two operations:*

1. *Finite sums: if $f(\vec{x}, z)$ is primitive recursive, then so is the function*

$$g(\vec{x}, y) = \sum_{z=0}^y f(\vec{x}, z).$$

2. *Finite products: if $f(\vec{x}, z)$ is primitive recursive, then so is the function*

$$h(\vec{x}, y) = \prod_{z=0}^y f(\vec{x}, z).$$

Proof. For example, finite sums are defined recursively by the equations

$$\begin{aligned} g(\vec{x}, 0) &= f(\vec{x}, 0) \\ g(\vec{x}, y + 1) &= g(\vec{x}, y) + f(\vec{x}, y + 1). \end{aligned}$$

\square
